

Assignment 1: Analyze a given business scenario and create an ER diagram that includes entities, relationships, attributes, and cardinality. Ensure that the diagram reflects proper normalization up to the third normal form.

Identify Entities and Attributes:

Start by brainstorming the main objects or concepts that hold relevant information

for your business. These become your entities.

For each entity, list the descriptive characteristics or properties you want to store.

These are the attributes.

Example Scenario (Library Management System):

Entities:

Book

Author

Borrower

Attributes:

Book: ISBN, Title, Publication Year, Genre

Author: Author ID (primary key), Name, Nationality

Borrower: Borrower ID (primary key), Name, Contact Information

2. Define Relationships:

Consider how entities interact with each other. A relationship represents an association between two or more entities.

Relationships can be one-to-one (1:1), one-to-many (1:M), or many-to-many (M:N).

Example Scenario Relationships:

A Book can be written by one Author (1:M).

An Author can write many Books (M:1).

A Borrower can borrow many Books (M:N).

A Book can be borrowed by many Borrowers (M:N).

3. Normalize the ER Diagram:

Normalization is a process to minimize data redundancy and improve data integrity

in a database. There are three main normal forms (1NF, 2NF, and 3NF) with increasing levels of normalization.

1NF (First Normal Form): Eliminates repeating groups within an entity.

2NF (Second Normal Form): Ensures no partial dependencies on the primary key.

3NF (Third Normal Form): Eliminates transitive dependencies on the primary key.

Normalization Steps for the Library Example:

1NF: We already have 1NF as there are no repeating groups.

2NF: No partial dependencies exist based on primary keys (Author ID and Borrower ID).

3NF: The Borrower entity might have a transitive dependency on Book through the

Author entity. To address this, we can create a separate entity Book_Borrower to

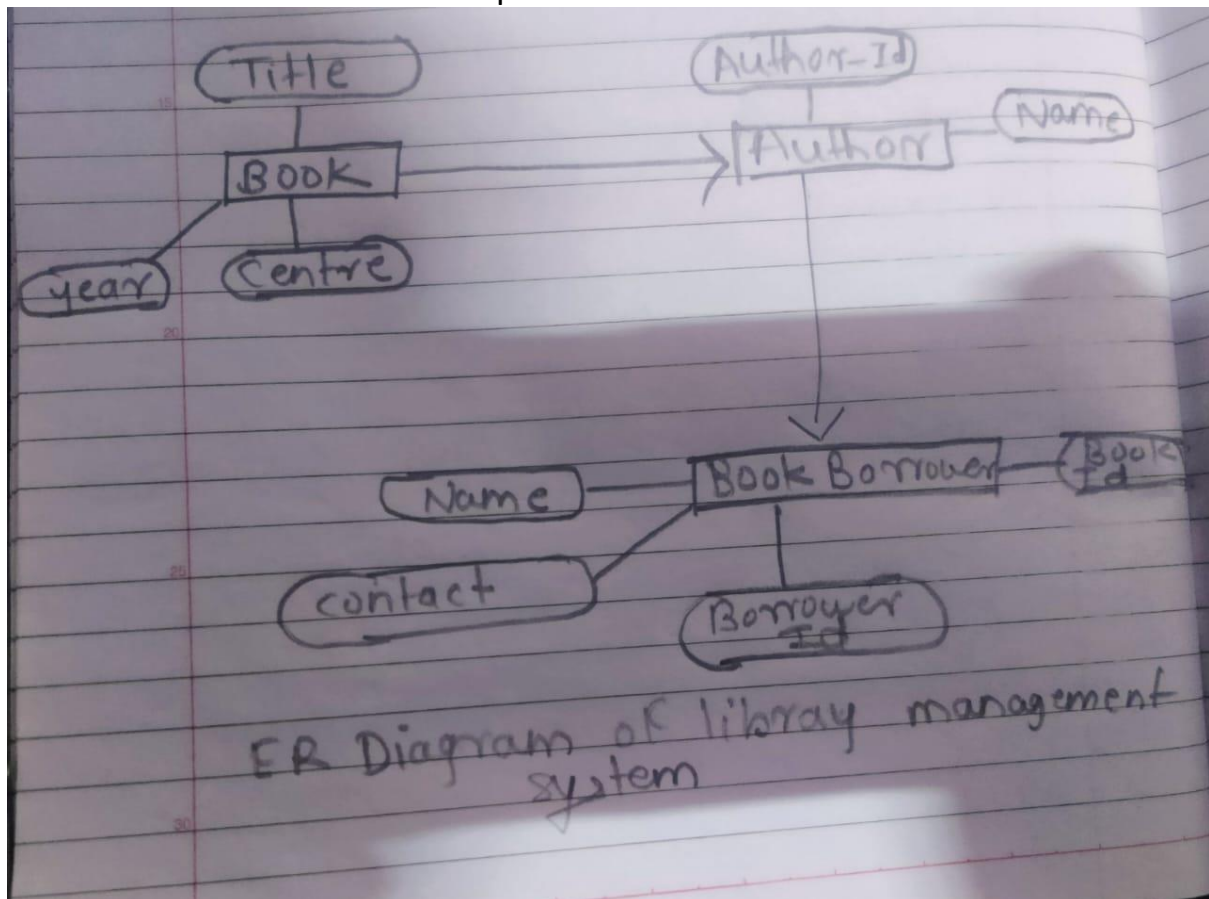

link Book and Borrower with their own primary key and eliminate the dependency.

4. Create the ER Diagram:

Use standard ERD symbols: Rectangles for entities, diamonds for relationships, ovals for attributes.

Label entities, attributes, and cardinalities (1:1, 1:M, M:N) on the connecting lines

between entities and relationships.

Assignment 2: Design a database schema for a library system, including tables, fields, and constraints like NOT NULL, UNIQUE, and CHECK. Include primary and foreign keys to establish relationships between tables.

CREATE TABLE Books (

```
BookID INT AUTO_INCREMENT PRIMARY KEY,
Title VARCHAR(255) NOT NULL,
Author VARCHAR(255) NOT NULL,
ISBN VARCHAR(20) NOT NULL UNIQUE
);
INSERT INTO Books (Title, Author, ISBN) VALUES
('1984', 'George Orwell', '9780451524935'),
('To Kill a Mockingbird', 'Harper Lee', '9780061120084'),
('Pride and Prejudice', 'Jane Austen', '9781503290563');
drop table books;
CREATE TABLE Borrowers (
BorrowerID INT AUTO_INCREMENT PRIMARY KEY,
FirstName VARCHAR(255) NOT NULL,
LastName VARCHAR(255) NOT NULL,
Email VARCHAR(255) UNIQUE,
PhoneNumber VARCHAR(15),
RegistrationDate DATE NOT NULL
);
INSERT INTO Borrowers (FirstName, LastName, Email,
PhoneNumber, RegistrationDate) VALUES
('John', 'Doe', 'john.doe@example.com', '1234567890', '2022-01-
01'),
('Jane', 'Smith', 'jane.smith@example.com', '0987654321', '2022-02-
15'),
('Emily', 'Johnson', 'emily.j@example.com', '1122334455', '2022-03-
20');
```

```

CREATE TABLE Loans (
    LoanID INT AUTO_INCREMENT PRIMARY KEY,
    BookID INT NOT NULL,
    BorrowerID INT NOT NULL,

    FOREIGN KEY (BookID) REFERENCES Books(BookID),
    FOREIGN KEY (BorrowerID) REFERENCES Borrowers(BorrowerID)
);

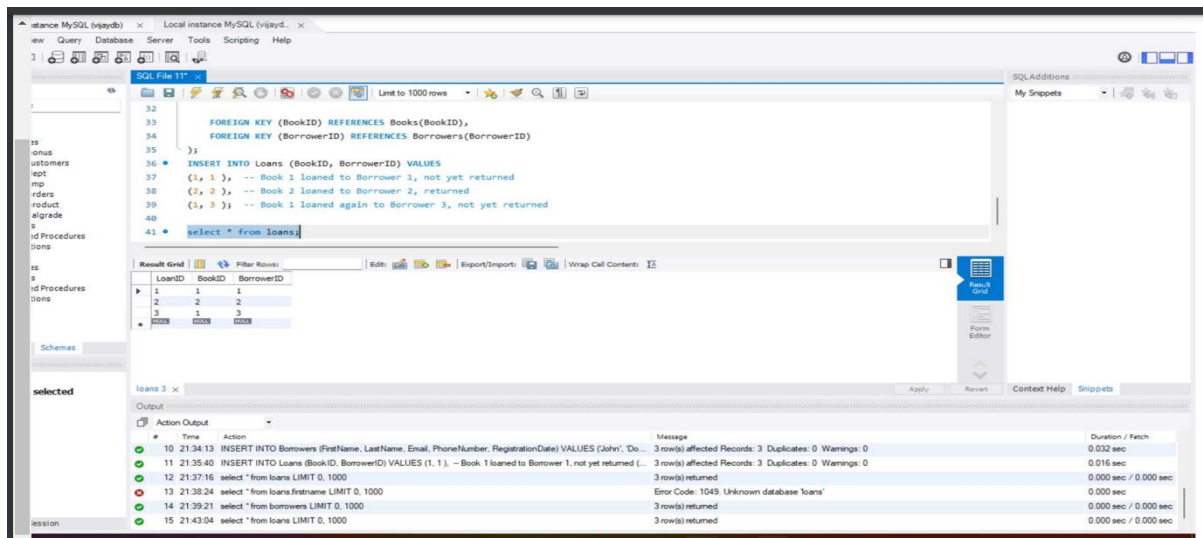

INSERT INTO Loans (BookID, BorrowerID) VALUES
(1, 1), -- Book 1 loaned to Borrower 1, not yet returned
(2, 2), -- Book 2 loaned to Borrower 2, returned
(1, 3); -- Book 1 loaned again to Borrower 3, not yet returned

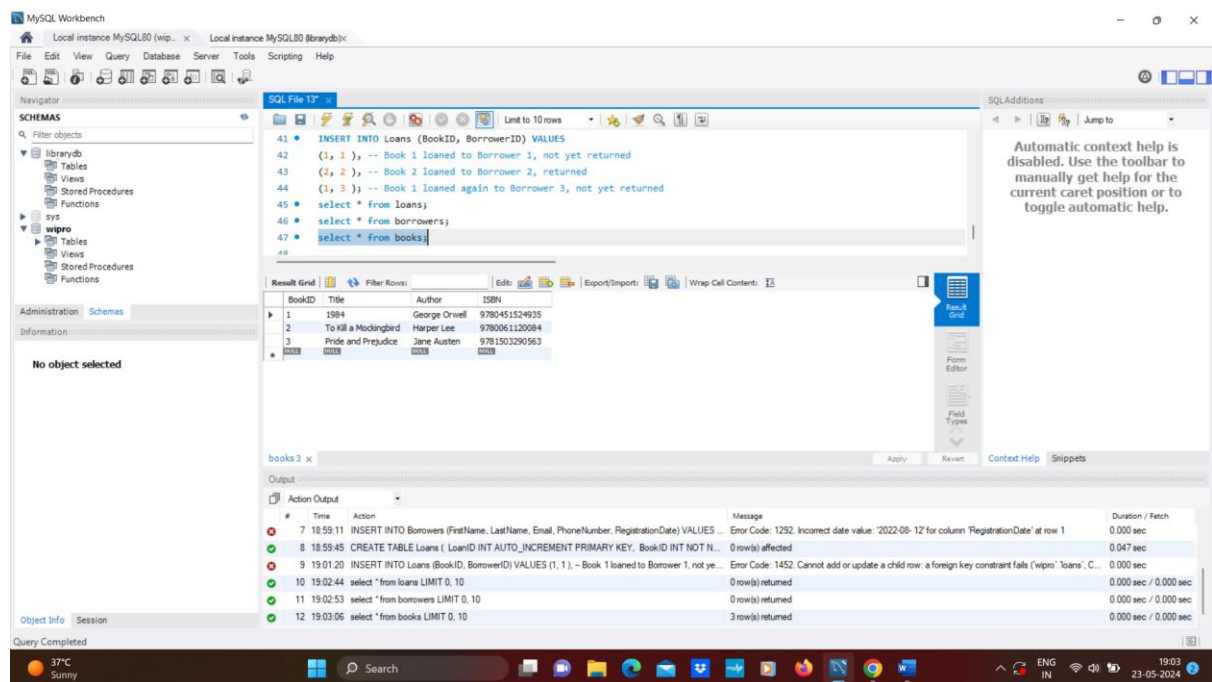

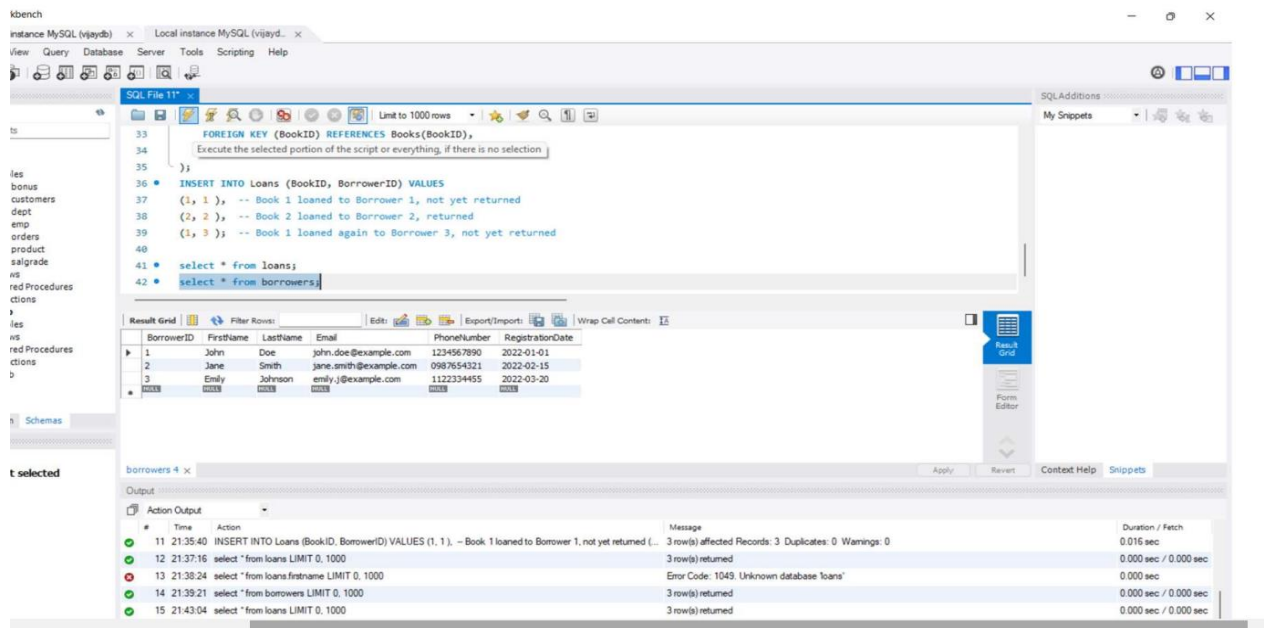

select * from loans;

select * from borrowers;

select * from books;

```

Assignment 3: Explain the ACID properties of a transaction in your own words. Write SQL statements to simulate a transaction that includes locking and demonstrate different isolation levels to show concurrency control.

Atomicity:

Ensures that a transaction is all or nothing. If any part of the transaction fails, the entire transaction is rolled back, leaving the database in its original state.

Consistency:

Ensures that a transaction brings the database from one valid state to another, maintaining the integrity constraints of the database.

Isolation:

Ensures that transactions are executed in isolation from one another.

Intermediate states of a transaction are not visible to other transactions until the transaction is committed.

Durability:

Ensures that once a transaction has been committed, it will remain so, even in the event of a system failure. The changes made by the transaction are permanently stored in the database.

Transaction Simulation with Explicit Locking

```
START TRANSACTION;
```

```
-- Lock the rows in the Accounts table for Alice and Bob
```

```
SELECT * FROM Accounts WHERE AccountID IN (1, 2) FOR UPDATE;
```

```
-- Deduct from Alice's account
```

```
UPDATE Accounts SET Balance = Balance - 200 WHERE AccountID = 1;
```

```
-- Add to Bob's account
```

```
UPDATE Accounts SET Balance = Balance + 200 WHERE AccountID =  
2;
```

```
COMMIT;
```

```
N n ,n,mnkmml/
```

Assignment 4: Write SQL statements to CREATE a new database and tables that reflect the library schema you designed earlier. Use ALTER statements to modify the table structures and DROP statements to remove a redundant table.

```
CREATE TABLE Books (  
  BookID INT AUTO_INCREMENT PRIMARY KEY,  
  Title VARCHAR(255) NOT NULL,  
  Author VARCHAR(255) NOT NULL,  
  ISBN VARCHAR(20) NOT NULL UNIQUE  
);
```

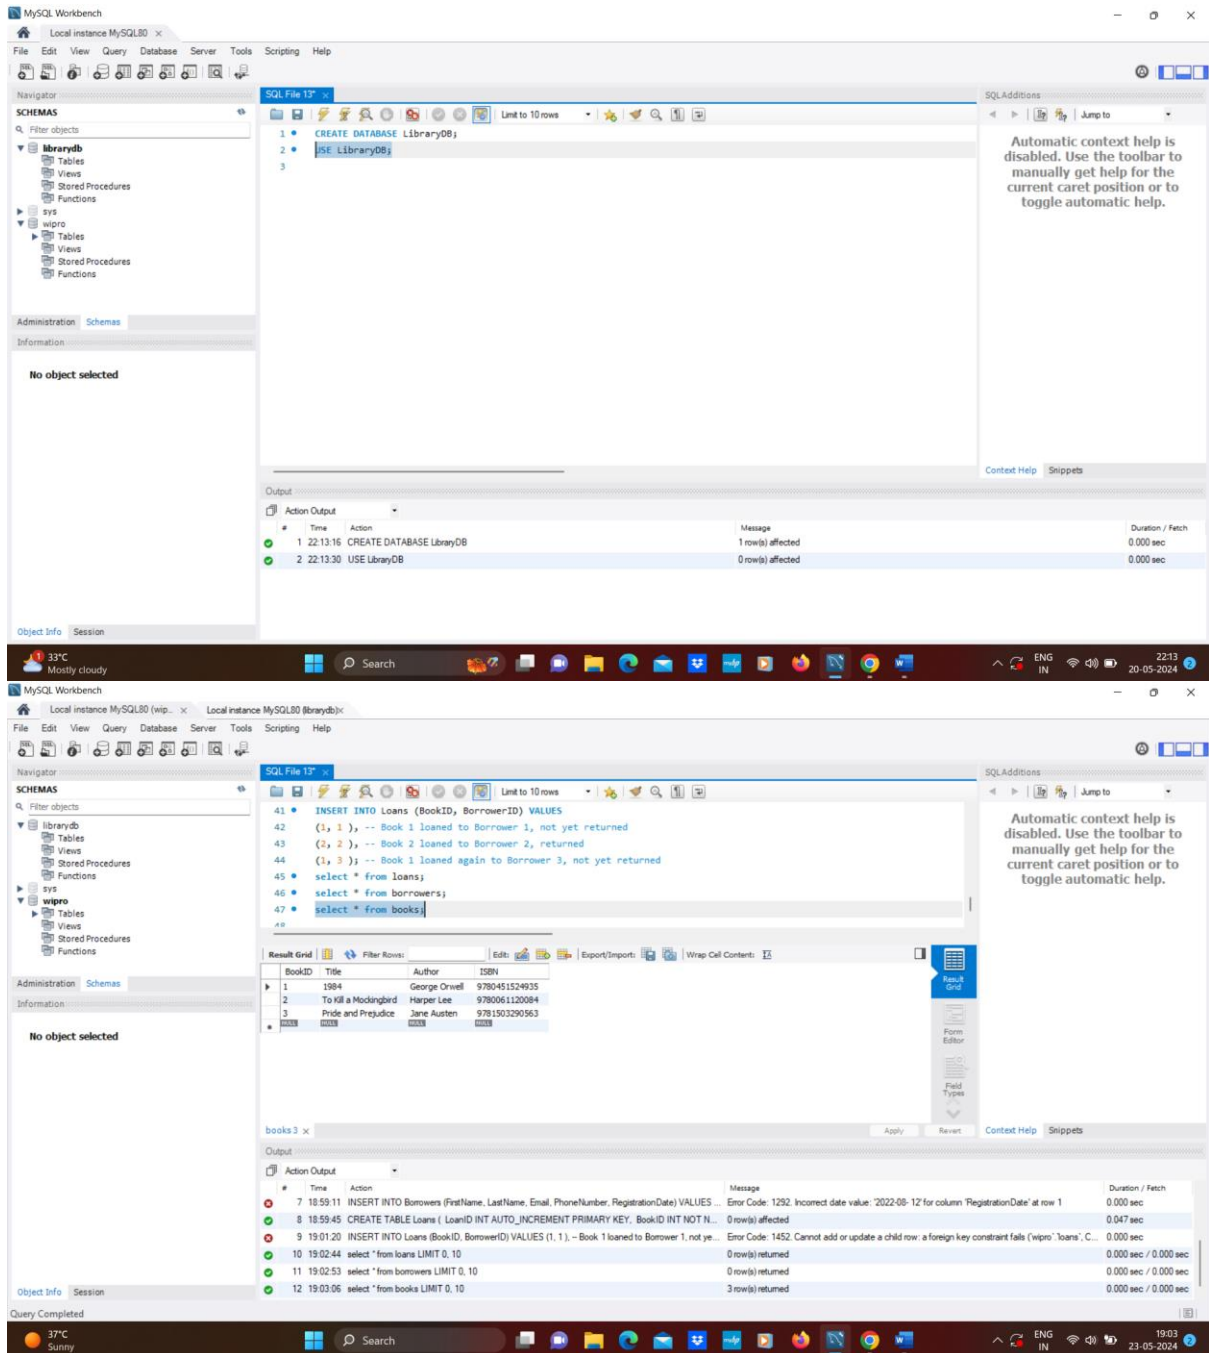

```
INSERT INTO Books (Title, Author, ISBN) VALUES
```

```
('1984', 'George Orwell', '9780451524935'),  
('To Kill a Mockingbird', 'Harper Lee', '9780061120084'),
```

```
('Pride and Prejudice', 'Jane Austen', '9781503290563');
```

```
drop table books;
CREATE TABLE Borrowers (
  BorrowerID INT AUTO_INCREMENT PRIMARY KEY,
  FirstName VARCHAR(255) NOT NULL,
  LastName VARCHAR(255) NOT NULL,
  Email VARCHAR(255) UNIQUE,
  PhoneNumber VARCHAR(15),
  RegistrationDate DATE NOT NULL
);
INSERT INTO Borrowers (FirstName, LastName, Email,
  PhoneNumber, RegistrationDate) VALUES
('John', 'Doe', 'john.doe@example.com', '1234567890', '2022-01-01'),
('Jane', 'Smith', 'jane.smith@example.com', '0987654321', '2022-02-15'),
('Emily', 'Johnson', 'emily.j@example.com', '1122334455', '2022-03-20');
CREATE TABLE Loans (
  LoanID INT AUTO_INCREMENT PRIMARY KEY,
  BookID INT NOT NULL,
  BorrowerID INT NOT NULL,

  FOREIGN KEY (BookID) REFERENCES Books(BookID),
  FOREIGN KEY (BorrowerID) REFERENCES Borrowers(BorrowerID)
);
INSERT INTO Loans (BookID, BorrowerID) VALUES
(1, 1 ),
(2, 2 ),
(1, 3 );
Step2:
Alter statement use
For add one extra column in table
For rename the column name
```

Step4 :

Use of drop command

Drop table xyz;

Assignment 5: Demonstrate the creation of an index on a table and discuss how it improves query performance. Use a DROP INDEX statement to remove the index and analyze the impact on query execution.

Create an index on the 'grade' column

CREATE INDEX idx_grade ON students (grade);

The screenshot shows a SQL script in the 'demo' window. The script creates a table named 'students' with columns 'id' (INT PRIMARY KEY), 'name' (VARCHAR(50)), 'age' (INT), and 'grade' (CHAR(1)). It then inserts five rows of data: (1, 'John', 20, 'A'), (2, 'Alice', 22, 'B'), (3, 'Bob', 21, 'A'), (4, 'Emma', 20, 'C'), and (5, 'Rike', 23, 'A'). Finally, it creates an index named 'idx_grade' on the 'grade' column.

The 'Output' window shows the execution results:

#	Time	Action	Message
4	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (1, 'John', 20, 'A')	1 row(s) affected
5	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (2, 'Alice', 22, 'B')	1 row(s) affected
6	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (3, 'Bob', 21, 'A')	1 row(s) affected
7	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (4, 'Emma', 20, 'C')	1 row(s) affected
8	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (5, 'Rike', 23, 'A')	1 row(s) affected
9	18:22:48	create INDEX idx_grade ON students (grade)	0 row(s) affected Records: 0 Duplicates: 0 Warnings: 0

Query without index

EXPLAIN SELECT * FROM students WHERE grade = 'A';

The screenshot shows the same SQL script as before, but with the addition of the query: `EXPLAIN SELECT * FROM students WHERE grade = 'A';` at the end.

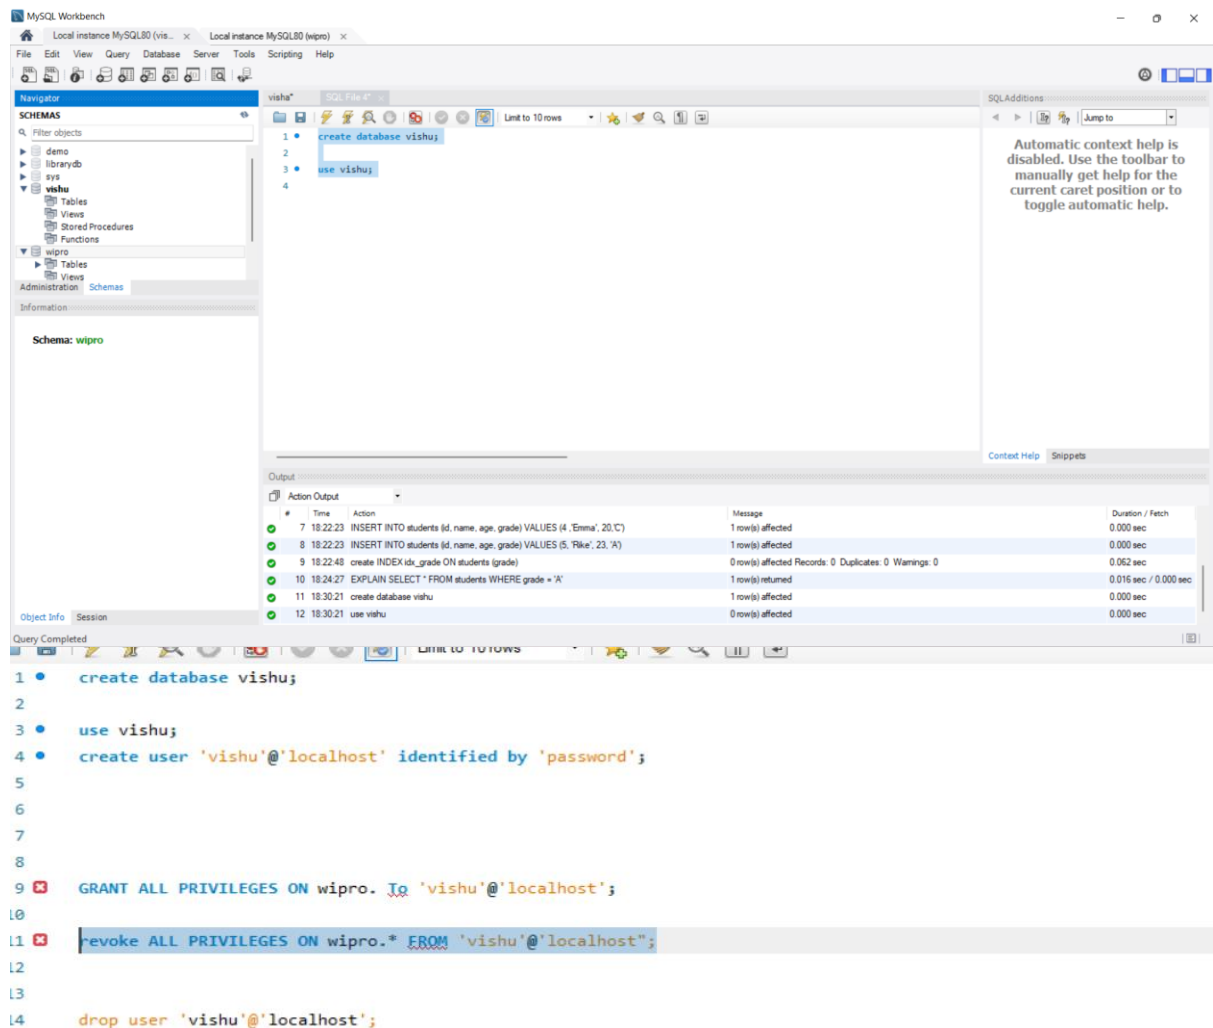

The 'Result Grid' shows the execution plan for the query:

id	select_type	table	partitions	type	possible_keys	key	key_len	ref	rows	filtered	Extra
1	SIMPLE	students	INDEX	ref	idx_grade	idx_grade	5	const	3	100.00	Using index condition

The 'Output' window shows the execution results for the EXPLAIN query:

#	Time	Action	Message
5	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (2, 'Alice', 22, 'B')	1 row(s) affected
6	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (3, 'Bob', 21, 'A')	1 row(s) affected
7	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (4, 'Emma', 20, 'C')	1 row(s) affected
8	18:22:23	INSERT INTO students (id, name, age, grade) VALUES (5, 'Rike', 23, 'A')	1 row(s) affected
9	18:22:48	create INDEX idx_grade ON students (grade)	0 row(s) affected Records: 0 Duplicates: 0 Warnings: 0
10	18:24:27	EXPLAIN SELECT * FROM students WHERE grade = 'A'	1 row(s) returned

Assignment 6: Create a new database user with specific privileges using the CREATE USER and GRANT commands. Then, write a script to REVOKE certain privileges and DROP the user.

Assignment 7: Prepare a series of SQL statements to INSERT new records into the library tables, UPDATE existing records with new information, and DELETE records based on specific criteria. Include BULK INSERT operations to load data from an external source.

INSERT INTO books (bookid, title, authorid, publishedyear, isbn, publisher)

VALUES

(1, 'To Kill a Mockingbird', 101, 1960, '978-0-06-112008-4', 'J.B. Lippincott & Co.'),

(2, '1984', 102, 1949, '978-0-452-28423-4', 'Secker & Warburg'),
 (3, 'The Great Gatsby', 103, 1925, '978-0-7432-7356-5', 'Charles
 Scribner\'s Sons');

The screenshot shows a SQL script in a text editor and its execution results in a table below.

```

14 • INSERT INTO students (id, name, age, grade) VALUES (5, 'Mike', 23, 'A');
15 • CREATE INDEX idx_grade ON students (grade);
16 • EXPLAIN SELECT * FROM students WHERE grade = 'A';
17
18
19 • select * from books;
20
21 • ALTER TABLE books MODIFY isbn VARCHAR(20);
22
23 • INSERT INTO books (bookid, title, authorid, publishedyear, isbn, publisher) VALUES
24 (1, 'To Kill a Mockingbird', 101, 1960, '978-0-06-112008-4', 'J.B. Lippincott & Co.'),
25 (2, '1984', 102, 1949, '978-0-452-28423-4', 'Secker & Warburg'),
26 (3, 'The Great Gatsby', 103, 1925, '978-0-7432-7356-5', 'Charles Scribner\'s Sons');
27
28
  
```
